

Managing IBCs with **ContainerTRACKER**[®]

IBC fleets are often difficult to control because of the way IBCs are used, cleaning issues and DOT testing requirements. **ContainerTRACKER**[®] software provides tracking tools to help you manage and control your valuable assets, and more importantly, solve your IBC related problems.

ContainerTRACKER[®] is extremely easy to use, feature rich and powerful. It can be easily integrated with barcode, RFID, GPS and existing software systems. **ContainerTRACKER**[®] provides these features that are useful for controlling your IBC inventory;

- Serialize Item Tracking,
- User defined item specific information per Serial # (original cost, purchase date, last test date, next test due date, additional equipment, etc.),
- User defined movement specific Information (Invoice, product, BOL, etc.),
- Event tracking provides lists and reminders (item due for testing, service, etc.),
- Immediate Location of any Serialized Item from all screens,
- Serialized Item History Reports,
- Last Trip Information,
- Rental Calculation for Items (owner may create unlimited rental plans for calculation).
- Alarms for Low or High Inventory (four total, 2 high and two low per item/location),
- 58 + Report Styles selected by user defined criteria generates millions of individual, reports from simple selection of familiar terms (location, item type, date, etc.),
- Report selections can be saved in 'Custom Reports' for standardized reporting, and,
- Email any report directly from within **ContainerTRACKER**[®].

Because tracking IBCs often involves your customers or partners **ContainerTRACKER**[®] has introduced Master licenses and sublicenses. These licenses allow organizations with partners (container manufacturers, logistics companies, assembly plants, or manufacturers that distribute product in IBCs) to inexpensively track assets throughout your partner network.

The problem of tracking cyclic assets like IBCs is always a local problem. Good partner network performance is defined as good performance at each partner location. Master licenses allow you to profitably or inexpensively provide a local tracking solution for your customers or partners. Rental calculation allows you to accurately calculate and/or offset the cost of your partner's poor performance.

Communication between partner locations is real-time by email. Users can email any report they view of the millions available. Creating standardized inventory and transaction reports (Custom Reports) allows you to communicate the specific management information necessary to identify and resolve problems.

ContainerTRACKER[®] allows you to automate your container management accepting input from barcode, RFID, GPS and existing software systems like ASNs. It also internally automates common tasks with alarms, messages and web-based communication.

You can get more information about **ContainerTRACKER**[®] by visiting our web site <http://www.container-tracker.com/>, or contact us (iig@iigsystems.com) to discuss how **ContainerTRACKER**[®] can help you and your partners control your valuable IBCs.
